

Workshop

PyPSA-Eur: A Sector-Coupled Open
Optimisation Model of the European Energy System

Dr. Iegor Riepin
(Technische Universität Berlin)

Training program by Green Deal Ukraina team
26-28 March 2025

What is PyPSA?

Our research focus:

- **Cost-effective pathways** to reduce greenhouse gas emissions
- **Evaluation** of grid expansion, hydrogen strategies, carbon management strategies
- **Co-optimisation** of generation, storage, conversion and transmission **infrastructure**
- **Algorithms** to improve the tractability of models
- **All open** source and open data

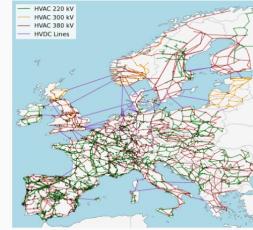

PyPSA

A python software toolbox for simulating and optimising modern power systems.

PyPSA:

Python for Power System Analysis

Capabilities

Capacity expansion (linear)

- single-horizon
- multi-horizon

Market modelling (linear)

- Linear optimal power flow
- Security-constrained LOPF
- Unit commitment
- Dispatch & redispatch

Non-linear power flow

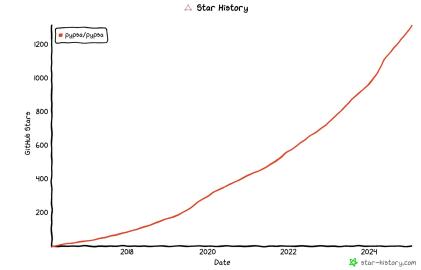

- Newton-Raphson

With components for

- Electricity transmission networks and pipelines.
- Generators with **unit commitment constraints**
- **Variable** generation with time series (e.g. wind and solar)
- **Storage** with efficiency losses and inflow/spillage for hydro
- **Conversion** between energy carriers (PtX, CHP, BEV, DAC)

Backend

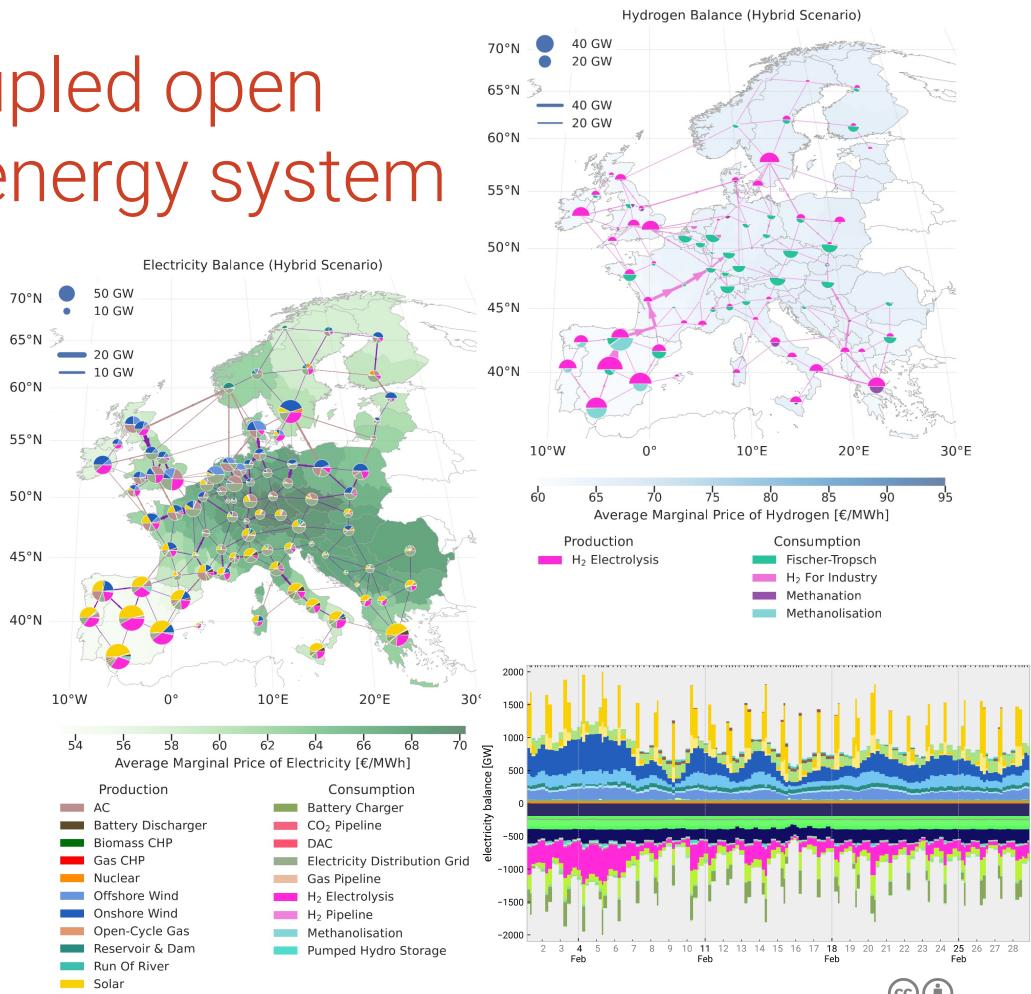

- all data stored in **pandas**
- framework built for performance with large networks and time series
- Interfaces to major **solvers** (Gurobi, CPLEX, HiGHS, Xpress), with **linopy** (by PyPSA devs)
- Highly **customisable**, but **no GUI**
- Suitable for greenfield, brownfield & pathway studies

PyPSA-Eur: A sector-coupled open model of the European energy system

Automated **workflow** to build energy system model of Europe from raw open data with high spatial and temporal resolution:

1. OSM transmission lines (>220 kV) + TYNDP
2. a database of existing **power plants**,
3. time series for electricity **demand**,
4. time series for wind/solar **availability**, and
5. geographic wind/solar **potentials**
6. **cost and efficiency assumptions**
7. methods for **model simplification**
8. more for sector-coupled networks like pipelines, LNG terminals, electric vehicles, industry locations, ... (*later*)

Energy infrastructure planning in PyPSA as an optimisation problem

Find the long-term cost-optimal energy system, including investments and short-term costs:

$$\text{Min} \left[\begin{array}{c} \text{Yearly} \\ \text{system costs} \end{array} \right] = \text{Min} \left[\sum_n \left(\begin{array}{c} \text{Annualised} \\ \text{capital costs} \end{array} \right) + \sum_{n,t} \left(\begin{array}{c} \text{Marginal} \\ \text{costs} \end{array} \right) \right]$$

subject to

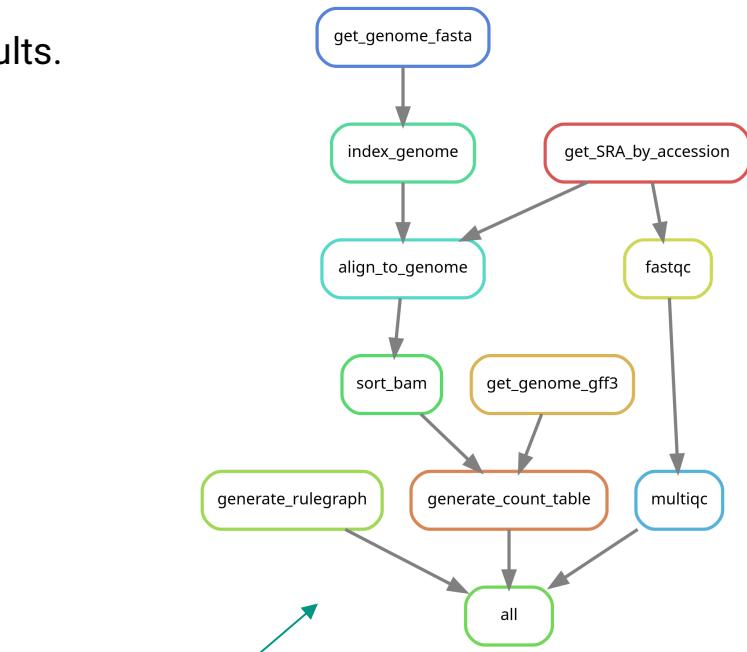

- meeting energy demand at each node n (e.g. region) and time t (e.g. hour of year) 
- transmission constraints between nodes and linearised power flow 
- wind, solar, hydro (variable renewables) availability time series $\forall n, t$ 
- installed capacity \leq geographical potentials for renewables 
- fulfilling CO₂ emission reduction targets
- Flexibility from gas turbines, battery/hydrogen storage, HVDC links

More on that later!

Challenges with data-driven modelling

Create a full pipeline of data processing from raw data to results.

- Many different data [sources](#)
- Many data sources need [cleaning](#) and [processing](#)
- Many [intermediate](#) scripts and datasets
- Data and software [dependencies](#) need to be managed
- Data and code [change](#) over time
- Want to be able to [reproduce](#) results
- Want to run many different [scenarios](#)

[snakemake](#)

Originally comes from bioinformatics field.

Miniature example of snakemake

Snakefile

```
rule mytask:  
    input:  
        "data/{sample}.txt"  
    output:  
        "result/{sample}.txt"  
    script:  
        "scripts/mytask.py"
```

```
rule myplot:  
    input:  
        "result/{sample}.txt"  
    output:  
        "figures/{sample}.pdf"  
    script:  
        "scripts/myplot.py"
```

command:

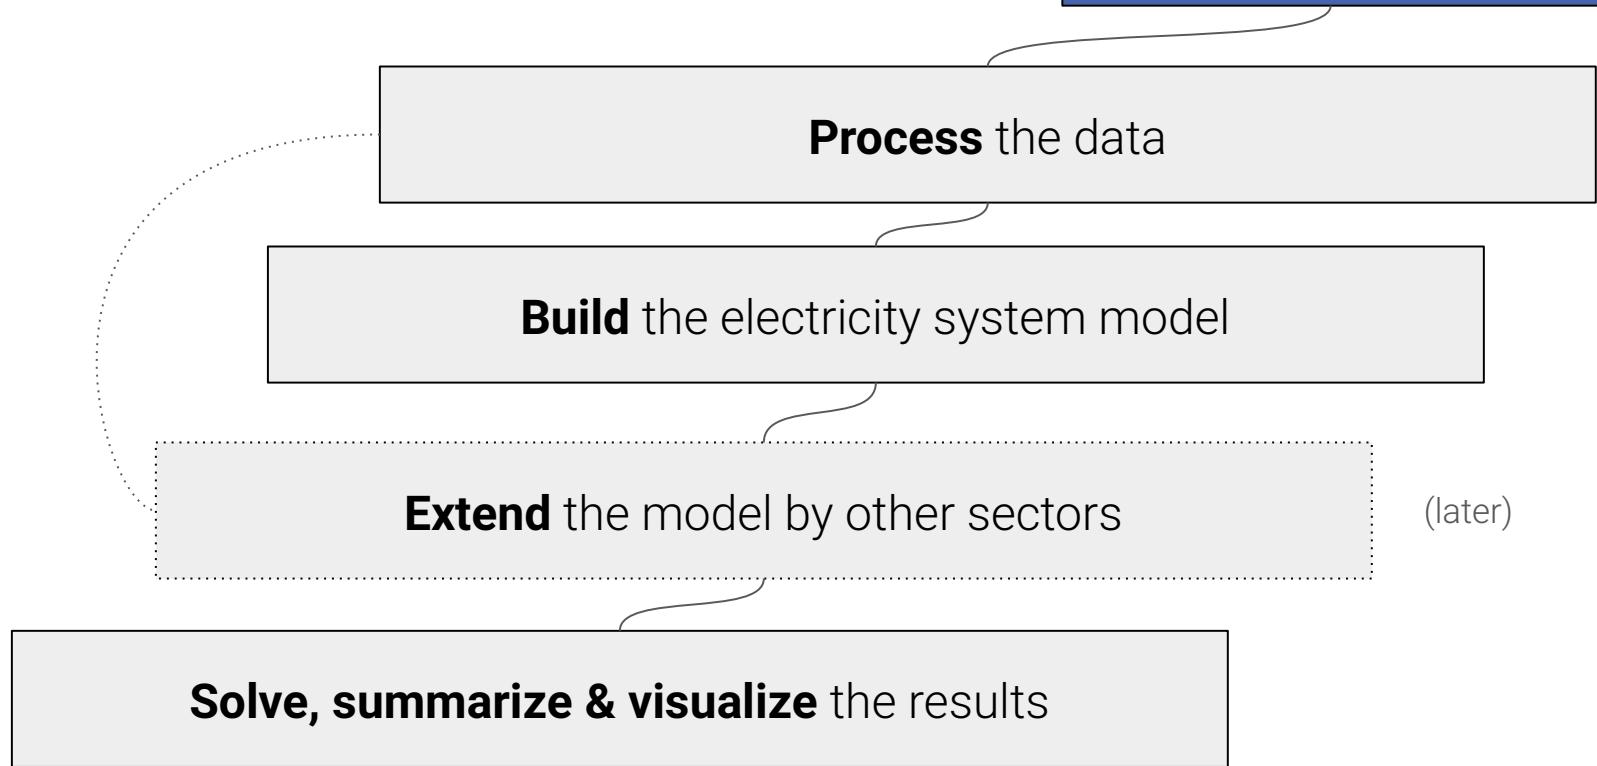

```
$ snakemake figures/myfigure.pdf
```

| Determine eligible areas for utility-scale PV & onshore/offshore wind park development | <code>determine_availability_matrix</code> |
| Build renewable capacity factor profiles for each clustered region based on land availability | <code>build_renewable_profiles,</code> <code>build_hydro_profile</code> |

atlite: Convert weather data to energy systems data

Python library for converting **weather data** (e.g. wind, solar radiation, temperature, precipitation) into **energy systems data**:

- solar photovoltaics
- solar thermal collectors
- wind turbines
- hydro run-off, reservoir, dams
- heat pump COPs
- dynamic line rating (DLR)
- heating and cooling demand (HDD/CDD)

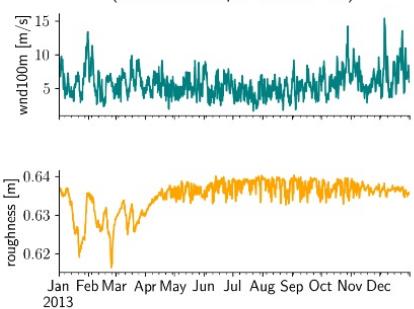

It can also perform **land eligibility analyses**.

Rule: build_renewable profiles

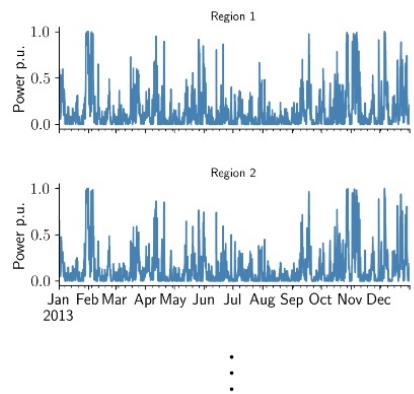

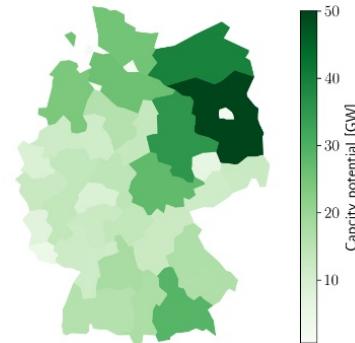

1. Create Cutout (Select spatio-temporal bounds)

2. Prepare Cutout (Retrieve data per weather cell)

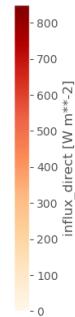

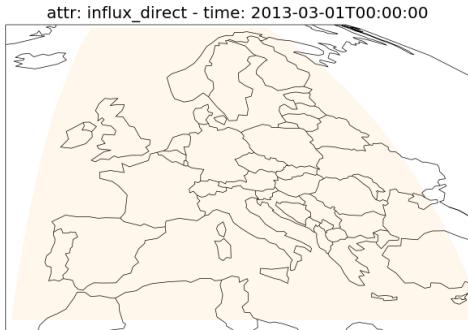

3. Convert Cutout (Calculate potentials and timeseries per region)

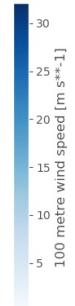

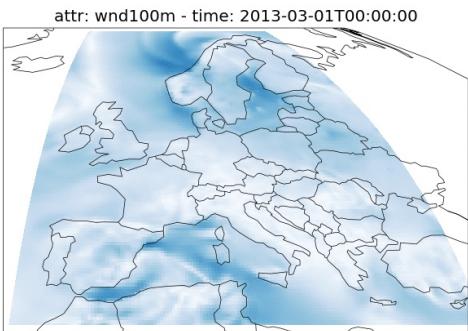

Time series for renewables

Historical meteorological weather data from ERA5 and SARAH-3
(up to 84 years, 30x30 km)

Temporal aggregation

Multiple options:

1. averaging of every Nth hour
2. sampling every Nth hour (e.g. 3-hourly)
3. Non-equidistant **segmentation** with pre-defined number of segments using the **tsam** Python library from FZ Jülich

Introduction

tsam - time series aggregation module

<https://tsam.readthedocs.io/en/latest/newsDoc.html>

Simplified workflow structure

Automated **downloads**

Process the data

Build the electricity system model

Extend the model by other sectors

(later)

Solve, summarize & visualize the results

linopy: Linear optimization with N-D labeled variables

pypi v0.5.0 CI license MIT

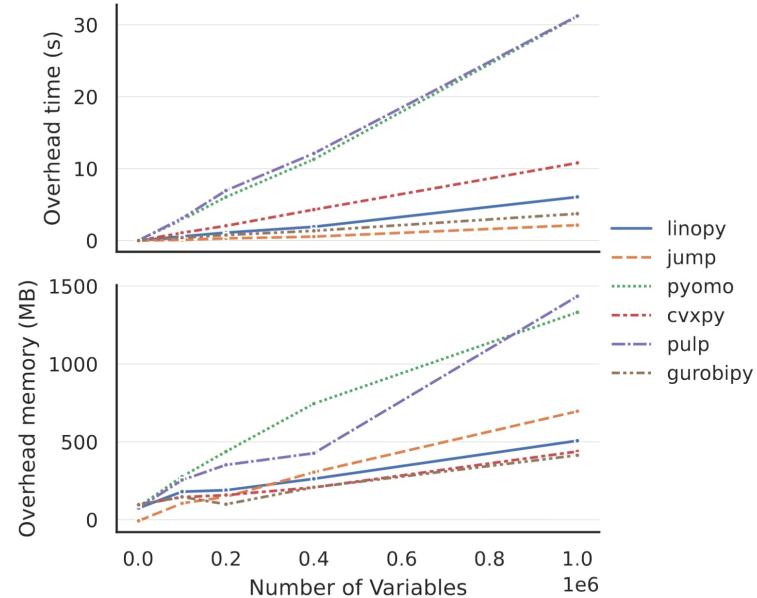

Python library that facilitates **optimization** with real-world, large-scale data.

It supports:

- Linear (LP),
- Mixed-Integer (MILP),
- Quadratic programming (QP).

It has been developed to make linear programming in Python easy, highly-flexible and – most importantly – **highly performant**.

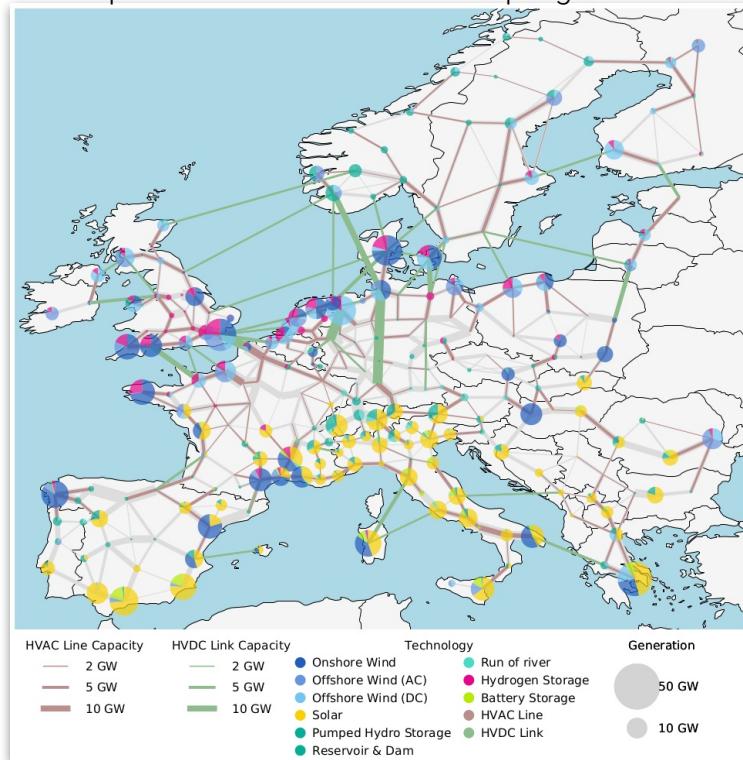

Solving and summarising networks

Hardware requirements:

- Building the model **can run locally** on most modern laptops. Very simple models can run with HiGHS solver.
- But access to a **commercial solver** and a larger **cluster/workstation** is required for solving problems (~250 GB RAM per scenario if resolution is very high)!

There is a **statistics module** in PyPSA designed to help with analysing solved networks and several figures/maps are created automatically.

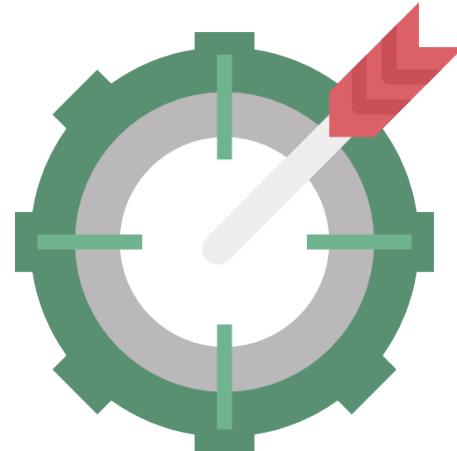

Example result without sector-coupling

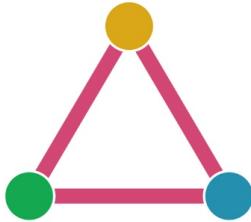

What is configurable?

electricity-only examples

- Select subset of countries and focus countries (e.g. only DE)
- Select weather year (1940 - 2024 for ERA5)
- Specify CO₂ constraint and gas usage limit
- Tweak spatial resolution (between 41 and >1000 nodes)
- Tweak temporal resolution (from hourly to N-hourly)
- Customize cost assumptions (e.g. 2020, 2030, 2050)
- Parametrize technologies (e.g. wind turbine type, panel orientation)
- Define land use eligibility criteria (e.g. distance requirements)
- Pick a solver (HiGHS, Gurobi, CPLEX, Xpress...)
- Choose between greenfield or brownfield expansion

Configuration

PyPSA-Eur has several configuration options which are documented in this section and are collected in a `config/config.yaml` file. This file defines deviations from the default configuration (`config/config.default.yaml`); confer installation instructions at [Handling Configuration Files](#).

Top-level configuration

“Private” refers to local, machine-specific settings or data meant for personal use, not to be shared. “Remote” indicates the address of a server used for data exchange, often for clusters and data pushing/pulling.

```
version: v2025.01.0
tutorial: false

logging:
    level: INFO
    format: '%(levelname)s:(%name)s:(%message)s'

private:
    keys:
        entsoe_api:

remote:
    ssh: ""
    path: ""
```

| | Unit | Values | Description |
|----------|------|---------------|------------------------------------------------------------------------|
| version | – | 0.x.x | Version of PyPSA-Eur. Descriptive only. |
| tutorial | bool | {true, false} | Switch to retrieve the tutorial data set instead of the full data set. |
| logging | | | |

Live Demo – Belgium / electricity-only / few days

Start with a dry-run:

```
$ snakemake solve_elec_networks --configfile config/test/config.electricity.yaml -n
```

Don't forget to activate your conda environment first!

Then execute the same command “for real” by dropping “-n” flag:

The “-j1” flag tells snakemake to run one job at a time.

```
$ snakemake -j1 solve_elec_networks --configfile config/test/config.electricity.yaml
```

To explore results, start a Jupyter notebook:

```
$ jupyter notebook
```

Practical Phase

(electricity-only)

2) Install conda environment

Installation links:

- [Anaconda](#) (bigger download):
- [Miniconda](#) (recommended):

```
$ conda update conda  
$ conda env create -f envs/environment.yaml  
$ conda activate pypsa-eur
```

4) Explore PyPSA network in a Jupyter notebook

```
import pypsa  
fn = "results/test-elec/networks/base_s_5_elec_nc"  
n = pypsa.Network(fn)  
n.statistics()  
n.plot()
```

1) Download the repository

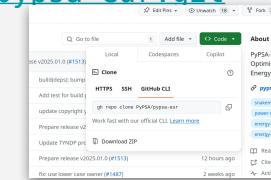

Open a terminal / CMD and type:

```
$ cd ~/path/to/my/directory  
$ git clone
```

<https://github.com/PyPSA/pypsa-eur.git>

```
$ cd pypsa-eur
```

You can also download
the repository as a ZIP
by hand.

3) Run PyPSA-Eur tutorial with snakemake

Guide:

<https://pypsa-eur.readthedocs.io/en/latest/tutorial.html>

```
$ snakemake solve_elec_networks  
--configfile  
config/test/config.electricity.yaml
```

Users of Windows, add two lines to YAML:

```
run:  
  use_shadow_directory: false
```

Small exploratory configuration tasks

(electricity-only)

Go to <https://pypsa-eur.readthedocs.io/en/latest/configuration.html> and try to find out how to configure some of the settings for **electricity-only models** listed below:

1. Increase the maximum line loading from 70% to 100%.
2. Disable power transmission grid reinforcements.
3. Activate dynamic line rating with default settings.
4. Activate linearised transmission loss approximation.
5. Deactivate the estimation of existing renewable capacities.
6. Change the techno-economic assumptions to the year 2020.
7. Remove the option to build hydrogen or battery storage.

Simplified workflow structure

Automated **downloads**

Process the data

Build the electricity system model

Extend the model by other sectors

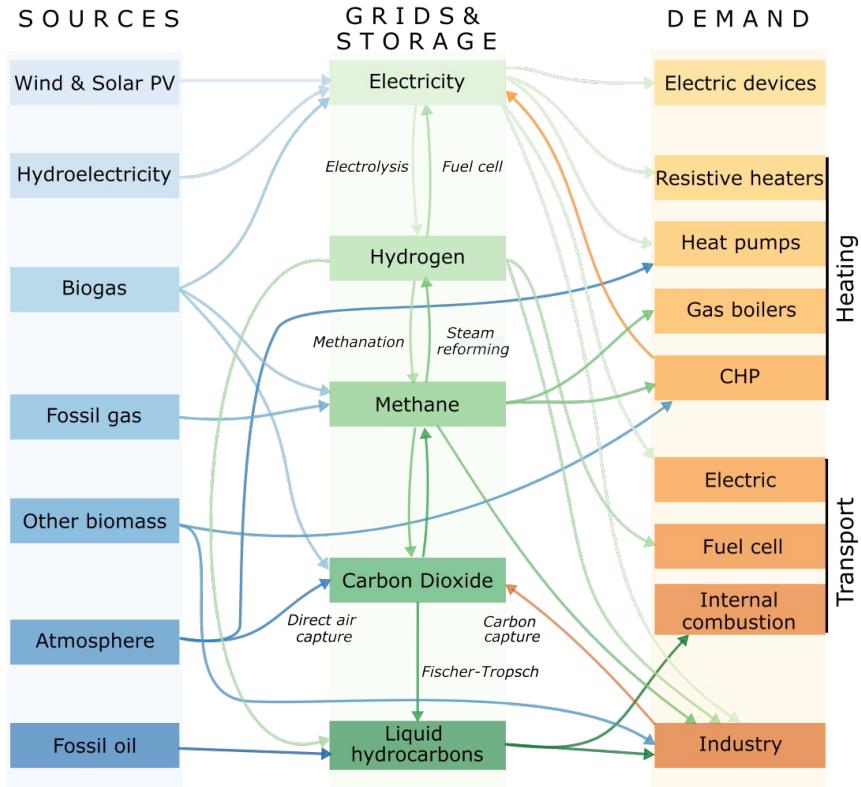

Solve, summarize & visualize the results

Coupling with other sectors

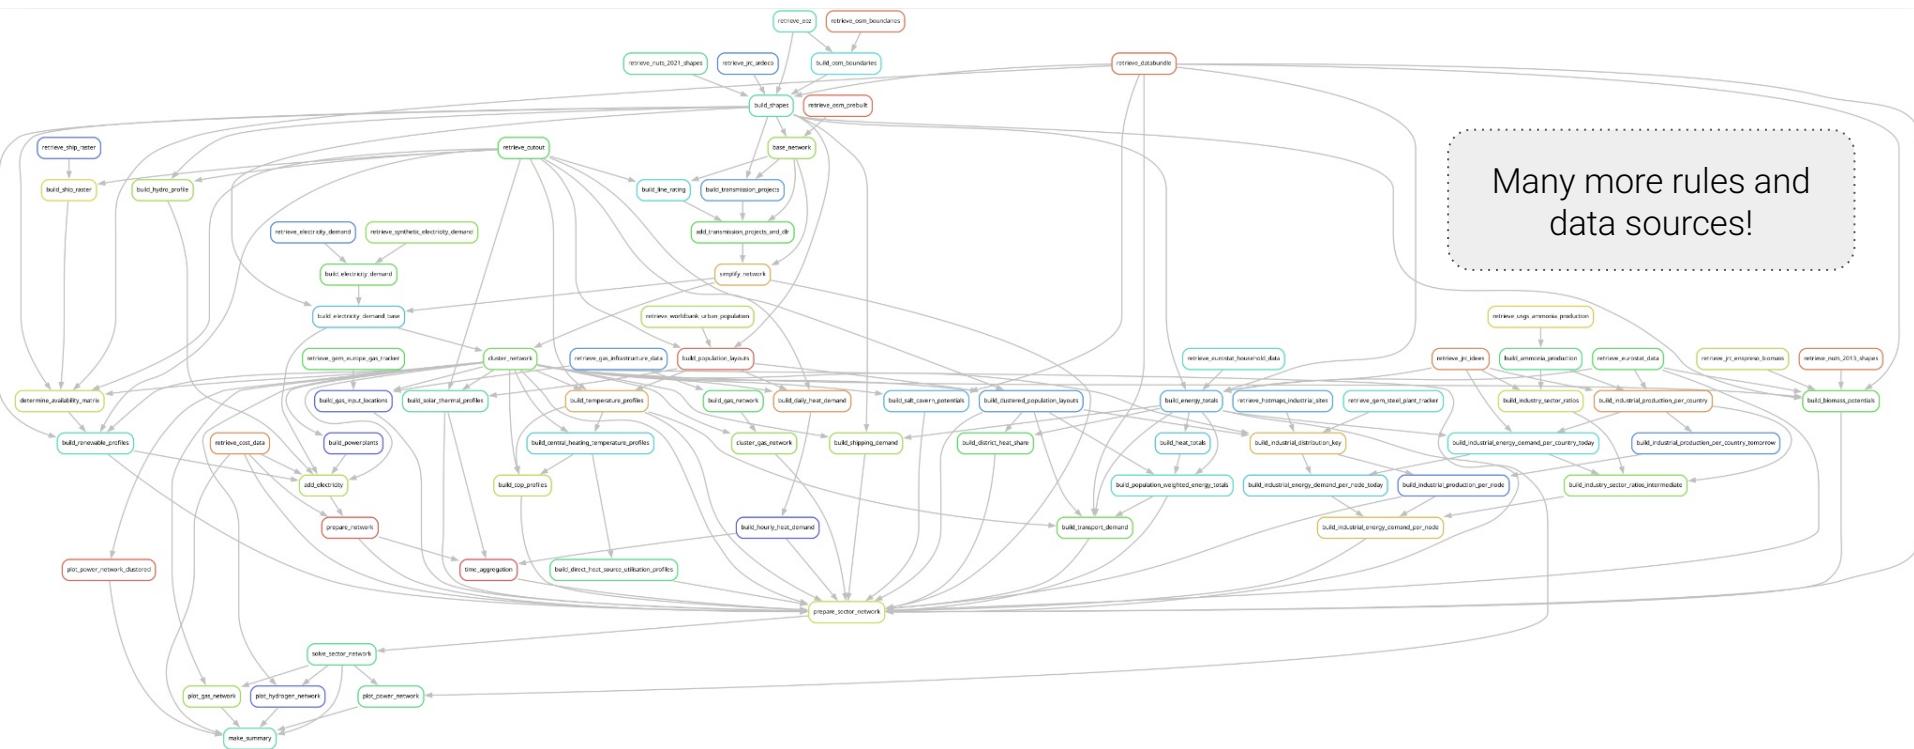

Need to decarbonise **all sectors** in Europe obeying spatial and temporal constraints.

- transport sector (EVs, shipping, aviation)
- heating sector (district heating, individual)
- industry sector (steel, chemicals, ammonia, ...)
- industrial feedstocks
- biomass resources
- carbon management (CCUTS)
- hydrogen, CO₂ and gas networks
- pathway optimisation (myopic, perfect)

Boundaries between energy and material model blur.

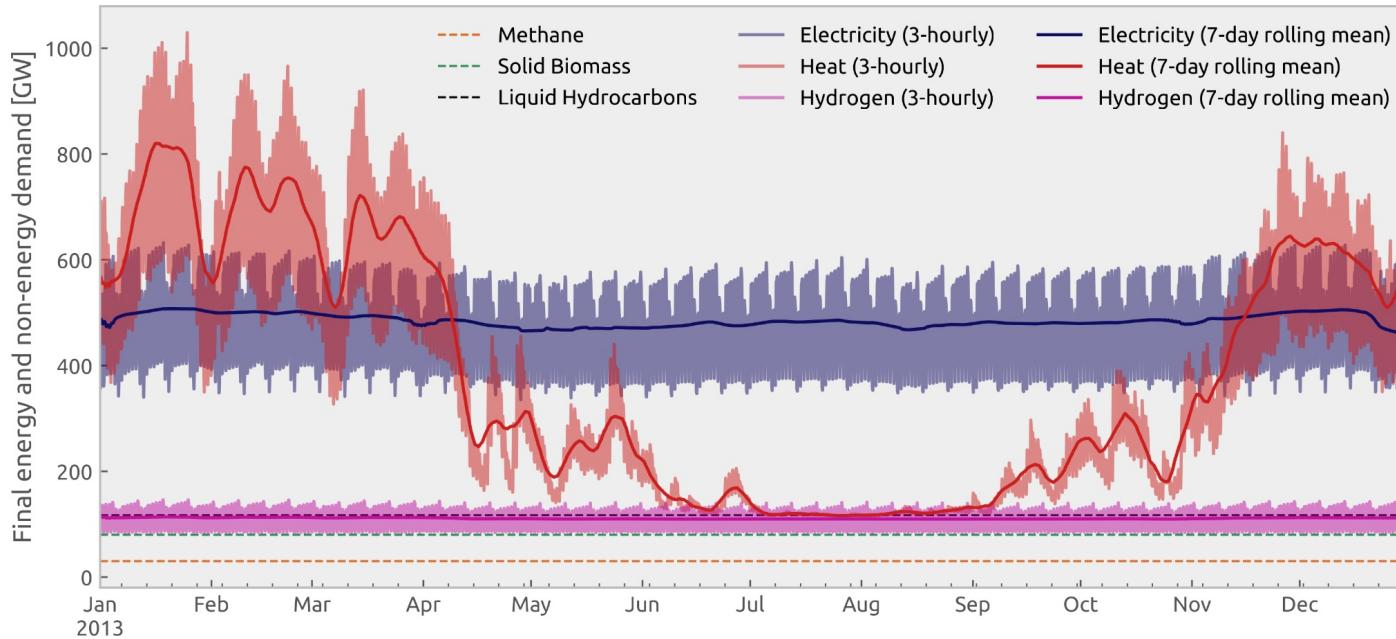

Extension by other sectors requires more data!

High-resolution version:
<https://tubcloud.tu-berlin.de/s/E7tx3BaqXsKXLre>

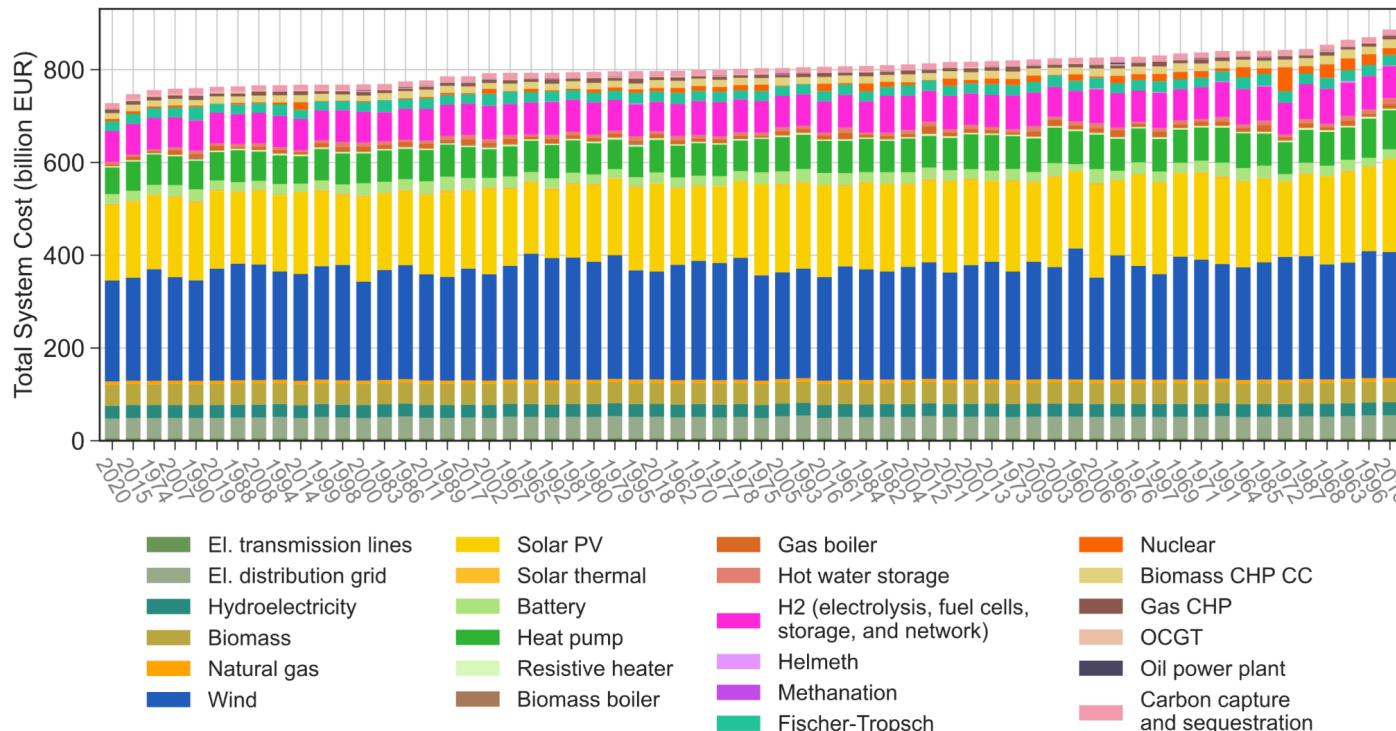

Temporal distribution of energy demands

From a temporal perspective, the **seasonal variation of heat demand** adds a challenge – it can coincide **periods of low wind and solar availability** and **varies from year to year**.

PyPSA-Eur can be run on different **weather years**!

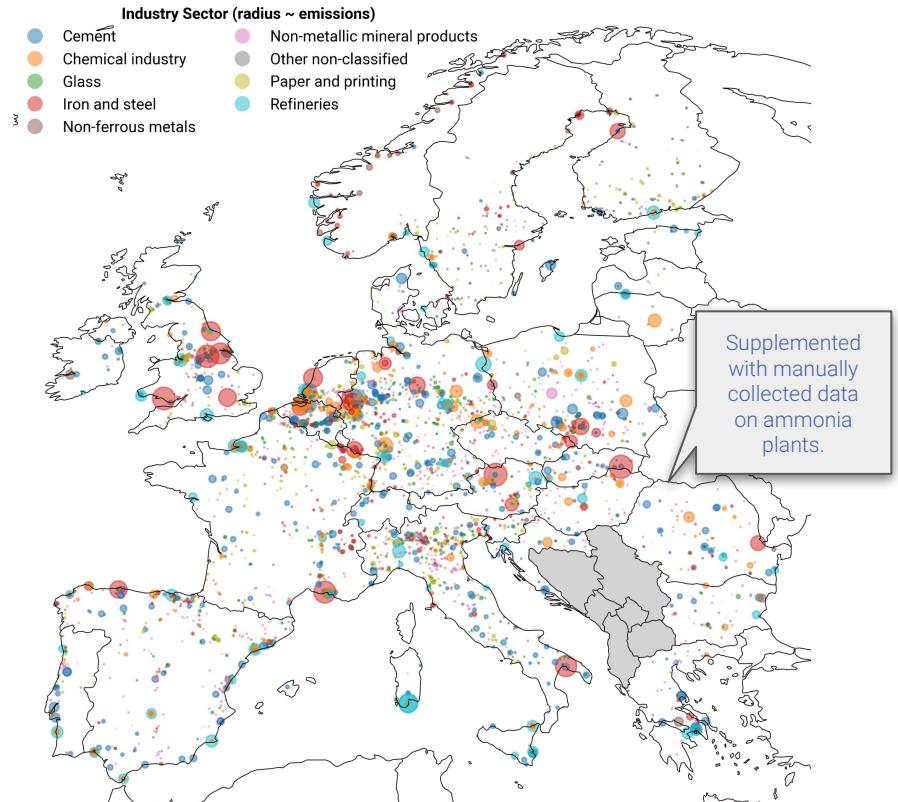

The years **2010, 2013, 2019** and **2023** are currently available "out of the box".

Other years **1940-2024** require a few more steps.

We are planning to expand the number of "plug-and-play" years.

Industry - Regionalisation based on Hotmaps

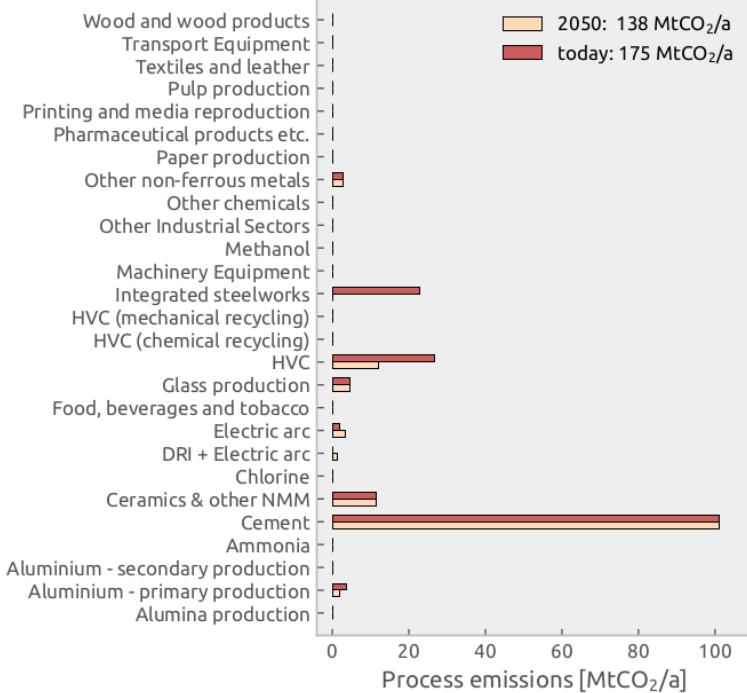

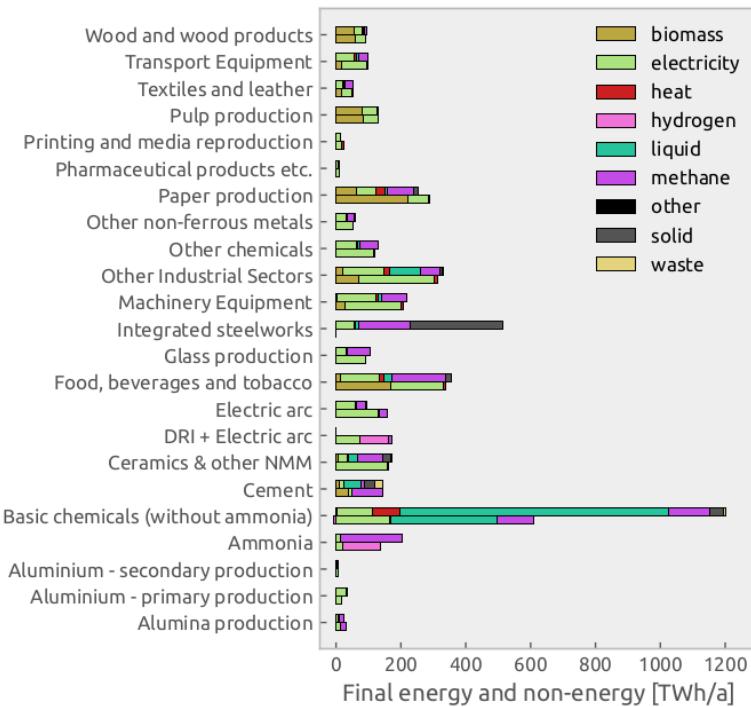

https://gitlab.com/hotmaps/industrial_sites/industrial_sites_Industrial_Database

| | |
|----------------|-------------------------------------------------------------------------------------------|
| Iron & Steel | Phase-out integrated steelworks; increased recycling; rest from H ₂ -DRI + EAF |
| Aluminium | Methane for high-enthalpy heat; increased recycling |
| Cement | Solid biomass; capture of CO ₂ emissions |
| Ceramics | Electrification |
| Ammonia | Gray, blue, green hydrogen |
| Plastics | Synthetic naphtha; MtO/MtA, increased recycling |
| Other industry | Electrification; process heat from biomass |
| Shipping | Methanol, (oil), (liquid hydrogen), (LNG) |
| Aviation | Kerosene from Fischer-Tropsch or methanol |

Modelling **industry relocation, high-temperature heat source & shipping fuels** endogenously is currently under development!

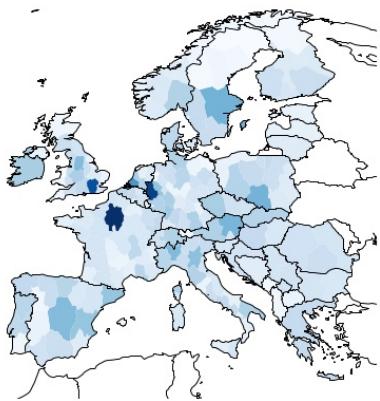

Industry - Fuel & process switching / process emissions

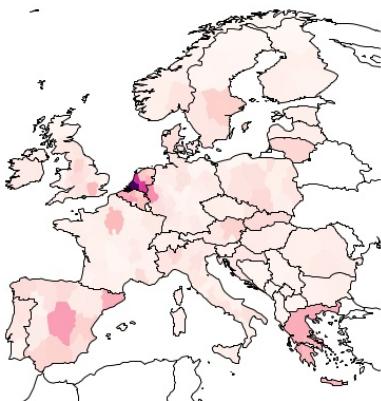

Currently, the most fuel & process switching in different industrial sectors is **exogenously configured** by the user. We're working to make these decisions **endogenous** to the model.

Spatial distribution of energy demands

(a) electricity demand

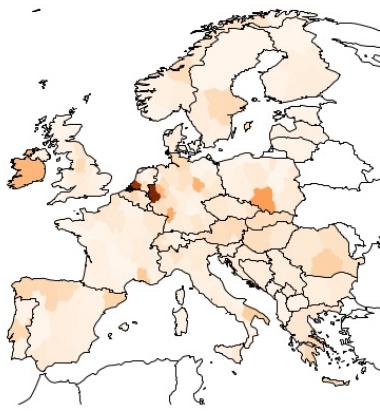

(b) hydrogen demand

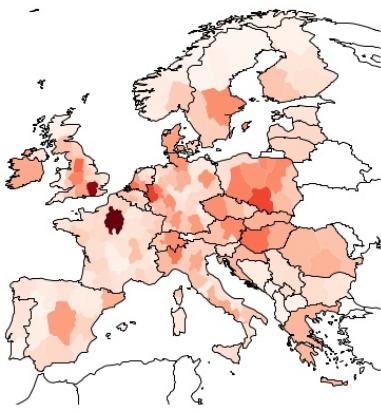

(e) oil-based product demand

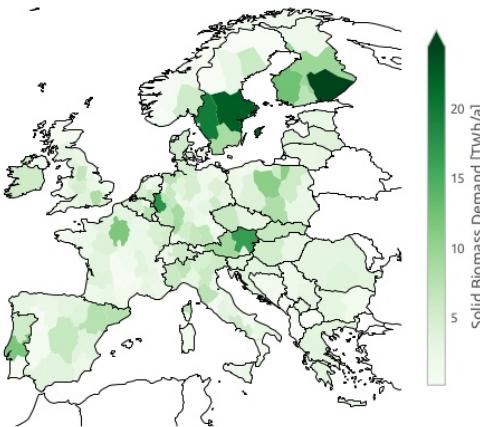

(c) methane demand

(d) heat demand

(f) solid biomass demand

Infrastructure - Gas network with H₂ retrofitting

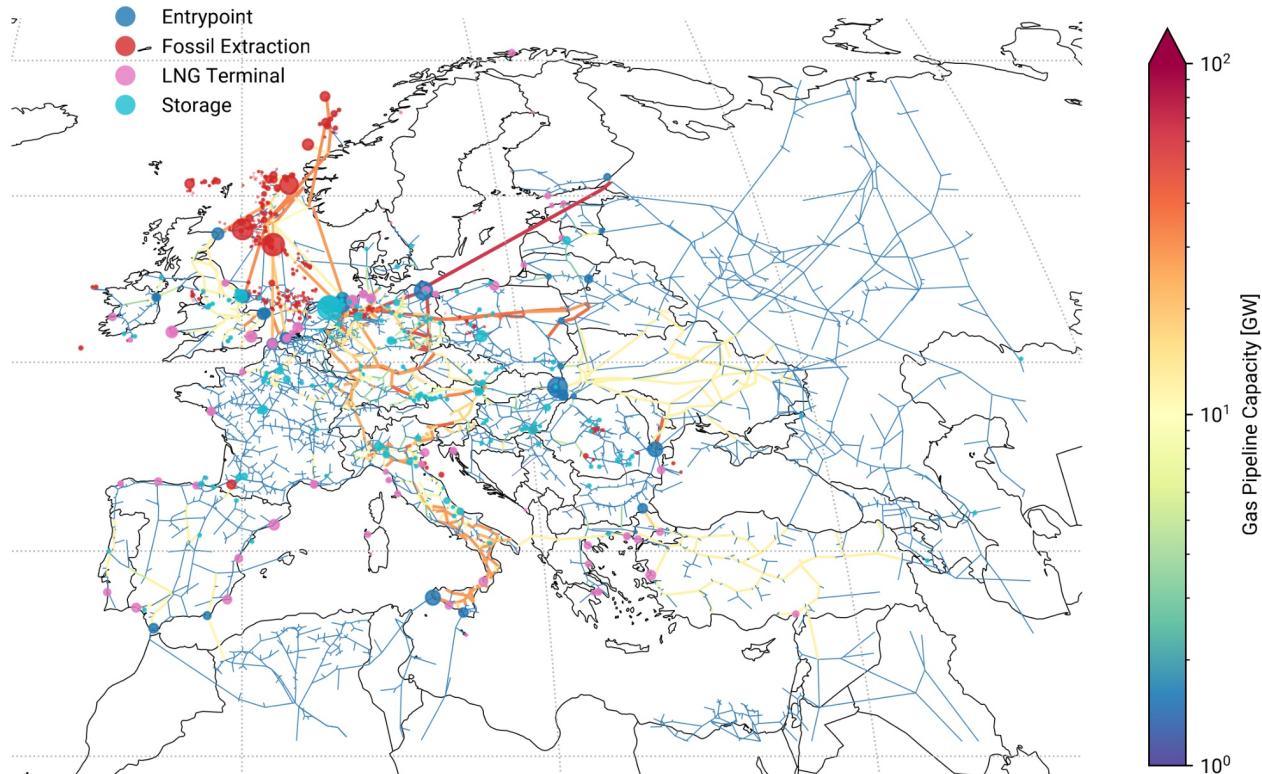

Compiled from open
SciGRID_gas dataset.

Fossil gas enters at **LNG terminals** or **gas fields**.

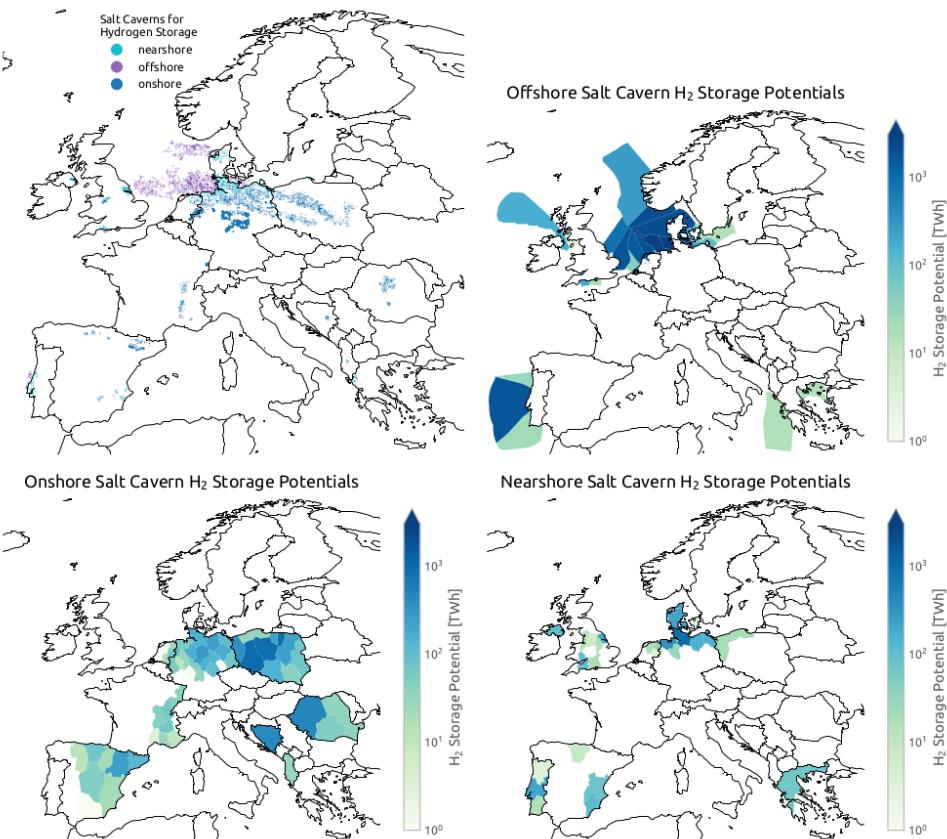

Gas flow **physics** and **valve control** neglected  transport model.

Electricity demand for
compression and **leakage configurable**.

Pipelines can be **retrofitted** to H₂ with costs from [EHB](#).

Infrastructure - Hydrogen storage potentials

The regional distribution of **geological potential** to store hydrogen in **salt caverns** is considered.

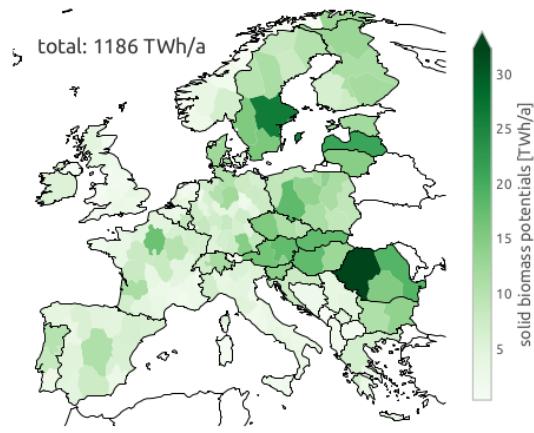

The user can **configure** if onshore and/or offshore potentials can be used.

Dilara Gulcin Caglayan, Nikolaus Weber, Heidi U. Heinrichs, Jochen Linßen, Martin Robinius, Peter A. Kukla, Detlef Stolten, *Technical potential of salt caverns for hydrogen storage in Europe*, **International Journal of Hydrogen Energy**, Volume 45, Issue 11, 2020, 6793-6805, <https://doi.org/10.1016/j.ijhydene.2019.12.161>

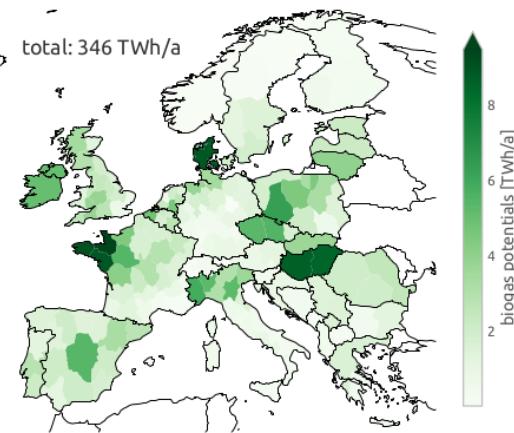

Infrastructure - Biomass from JRC ENSPRESO

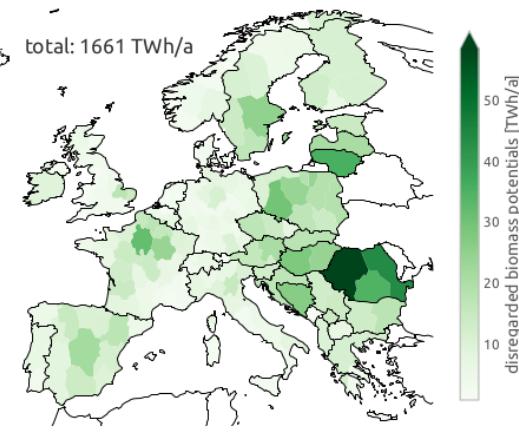

(a) solid biomass potentials

(b) biogas potentials

(c) potentials not included

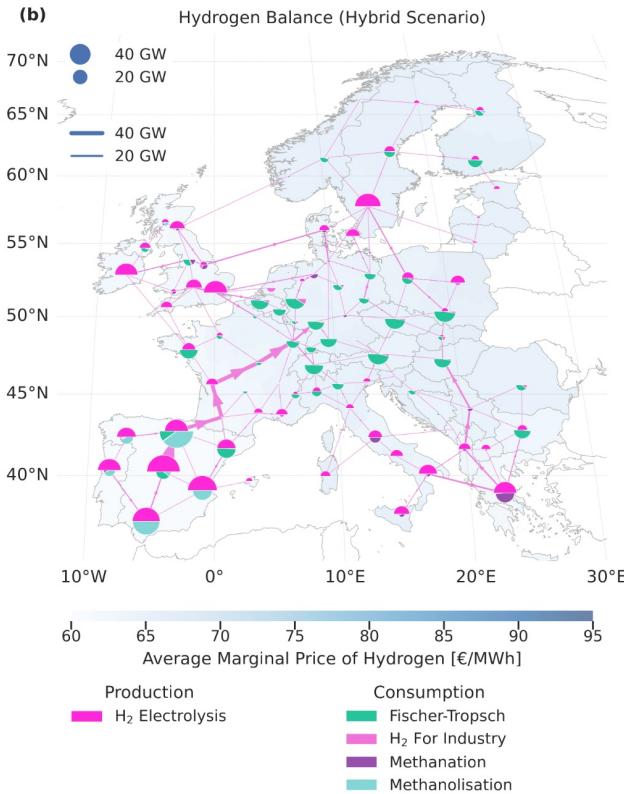

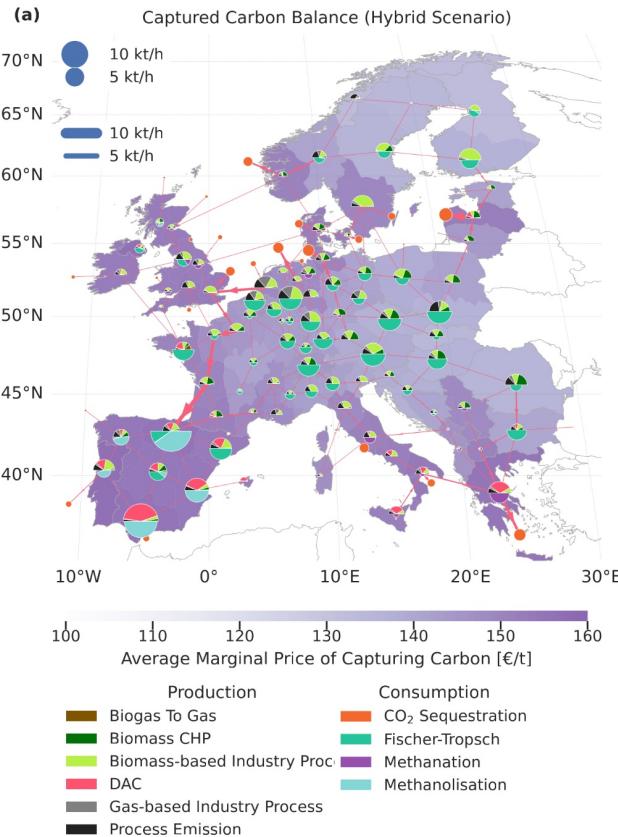

Biomass potentials are split between **solid biomass** and **biogas** (which can be, for instance, upgraded).

The user can configure low/medium/high potentials and what categories of biomass to consider (e.g. forest residues).

The default configuration only considers **residual biomass**, no energy crops.

Infrastructure - Carbon management

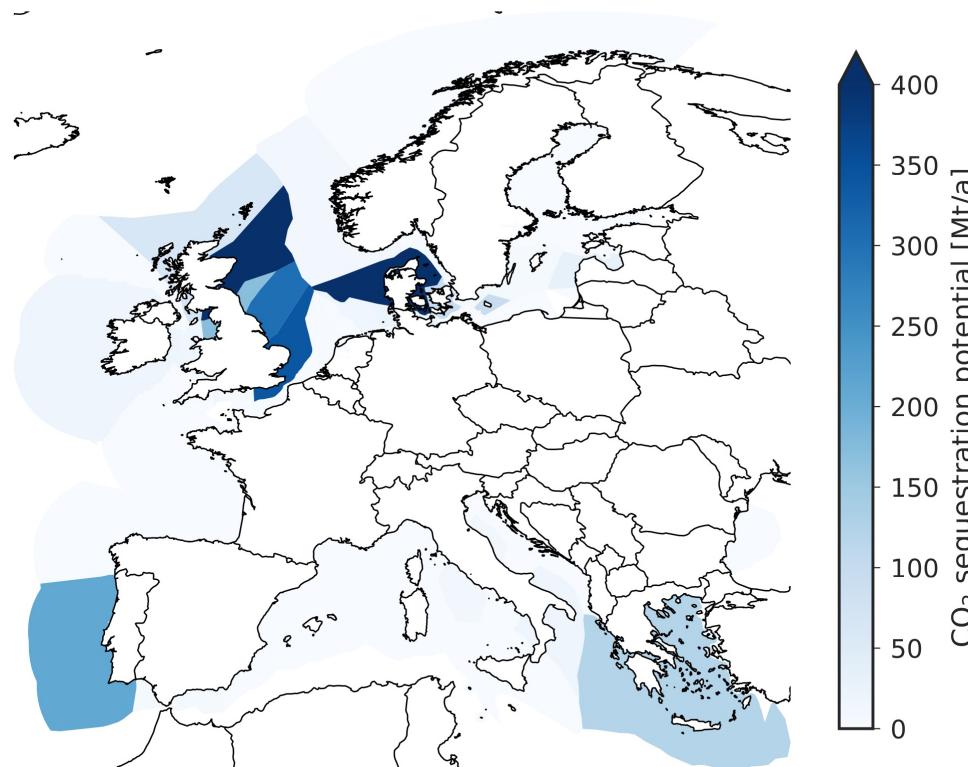

Built-in carbon flows:

- Capture:**
DAC, process emissions, fossil / biomass CHP
- Transport:**
CO₂ pipelines
- Storage:**
intermediate storage and long-term geological sequestration
- Utilization:**
for synthetic carbonaceous fuels

Infrastructure - Carbon sequestration potentials

Example: Offshore carbon sequestration potentials

The user can **configure**

- onshore/offshore sequestration,
- gas fields/oil fields/aquifer, and
- low/medium/high potentials,

as well as a **total limit** on the annual sequestration, e.g. 250 Mt per year.

Data source:

 CO2Stop - a project mapping both reserves and resources for CO₂ storage in Europe

By: Niels Poulsen (GEUS), Sam Holloway (BGS), Karen Kirk (BGS), Filip Neeli (TNO) and Nicola Ann Smith (BGS)

CO2Stop is the acronym for the "CO₂ Storage Potential in Europe" project. The CO2Stop project, which started in January 2012 and ended in December 2013, was funded by the European Commission (Project N°: ENER/CT/154-2011-SI2-01101). The CO2Stop project has mapped both reserves and resources for CO₂ storage in Europe. Further Latvia was covered by Estonia.

The results of the study are provided as a database of CO₂ storage locations throughout Europe, a Database of Geographical Information System (GIS) layers to compute storage capacities and injection rates (StoreP).

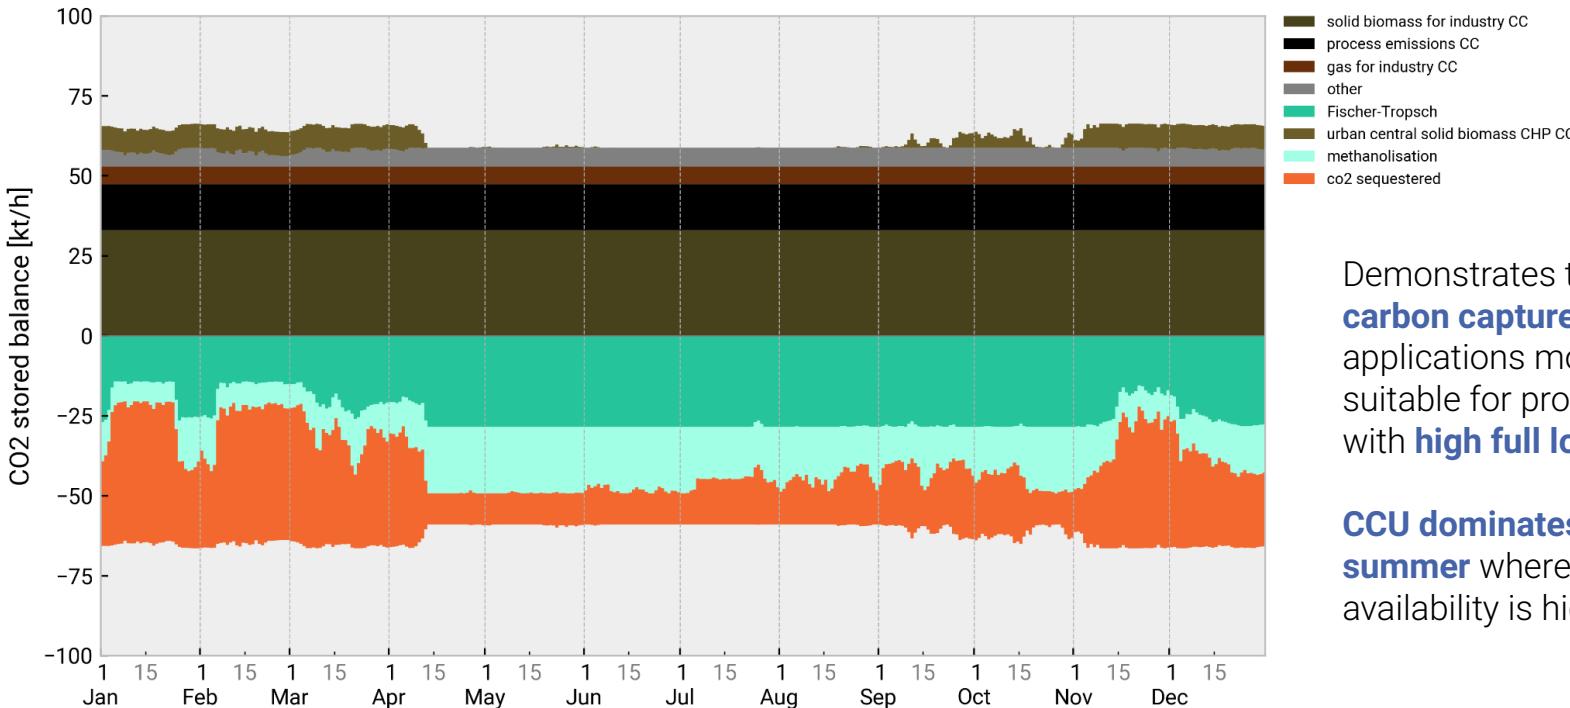

The database is now available on the website of the Joint Research Centre (JRC) ([https://www.jrc.ec.europa.eu/european-co2-storage-database/](http://www.jrc.ec.europa.eu/european-co2-storage-database/)) and will be available as an interactive web-based application (<http://www.jrc.ec.europa.eu/european-co2-storage-database/>). The Geological Data Infrastructure (EGDI) (www.eurogeogrid.eu/)

The CO2Stop database will be the first step towards a European Storage Atlas. Other databases are available for UK, Ireland, Norway, Sweden, and Denmark (www.co2stored.co.uk/home/index.html) and the Nordic CO₂ storage atlas is produced by NORCCS – the Nordic CCS Consortium (<http://www.nordicccslabut.htm>). Spain has published Atlas of Geological Structures that uphold a CO₂ storage potential in Spain (ISBN: 978-84-7840-928-0 Mayo 2013).

88 Countries covered by the CO2Stop project
32 Countries covered by the CO2StorageAtlas project
The boundary project included 26 countries and 27
Latvia was covered by Estonia

Examples - Carbon management on a time axis

Demonstrates that
carbon capture
applications most
suitable for processes
with **high full load hours**.

CCU dominates over
summer where solar
availability is high.

Heating - Tech for individual & district heating

Decentral individual heating

can be supplied by:

- air- or ground-sourced heat pumps
- resistive heaters
- gas / oil / biomass / hydrogen boilers
- solar thermal
- small water tanks

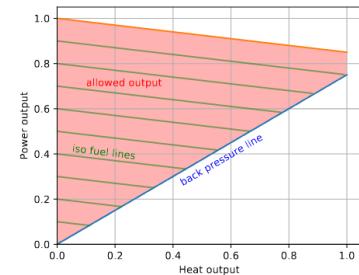

Building renovations can be co-optimized to reduce space heating demand.

District heating systems

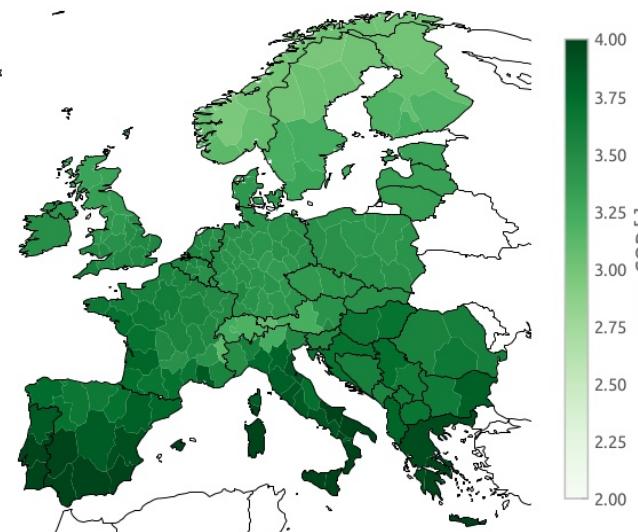

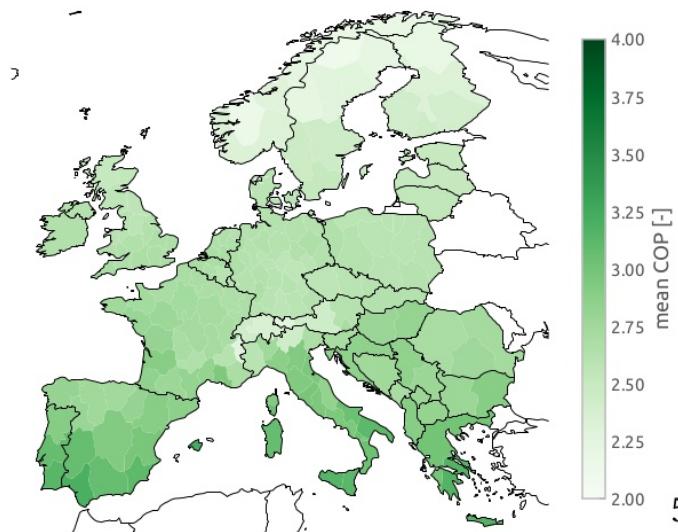

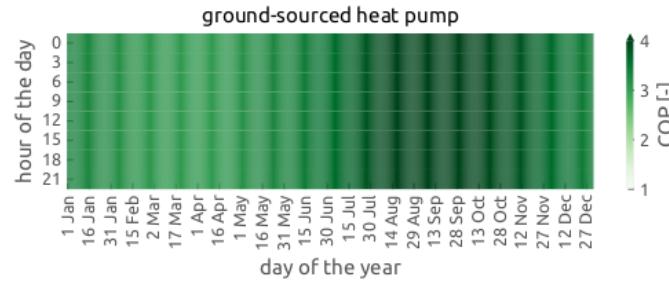

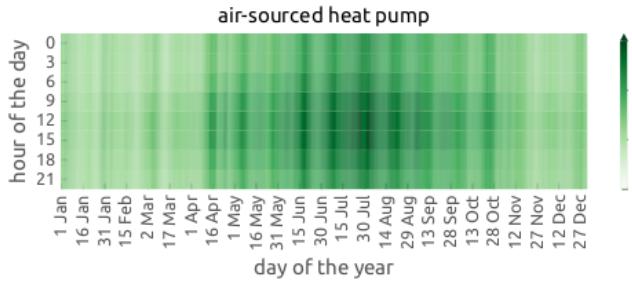

can be supplied in urban areas by:

- air-sourced heat pumps
- resistive heaters
- gas / hydrogen / biomass / waste CHPs
- gas / oil / biomass / hydrogen boilers
- solar thermal
- long-duration hot water storage
- waste heat from industrial processes

CHP feasible dispatch:

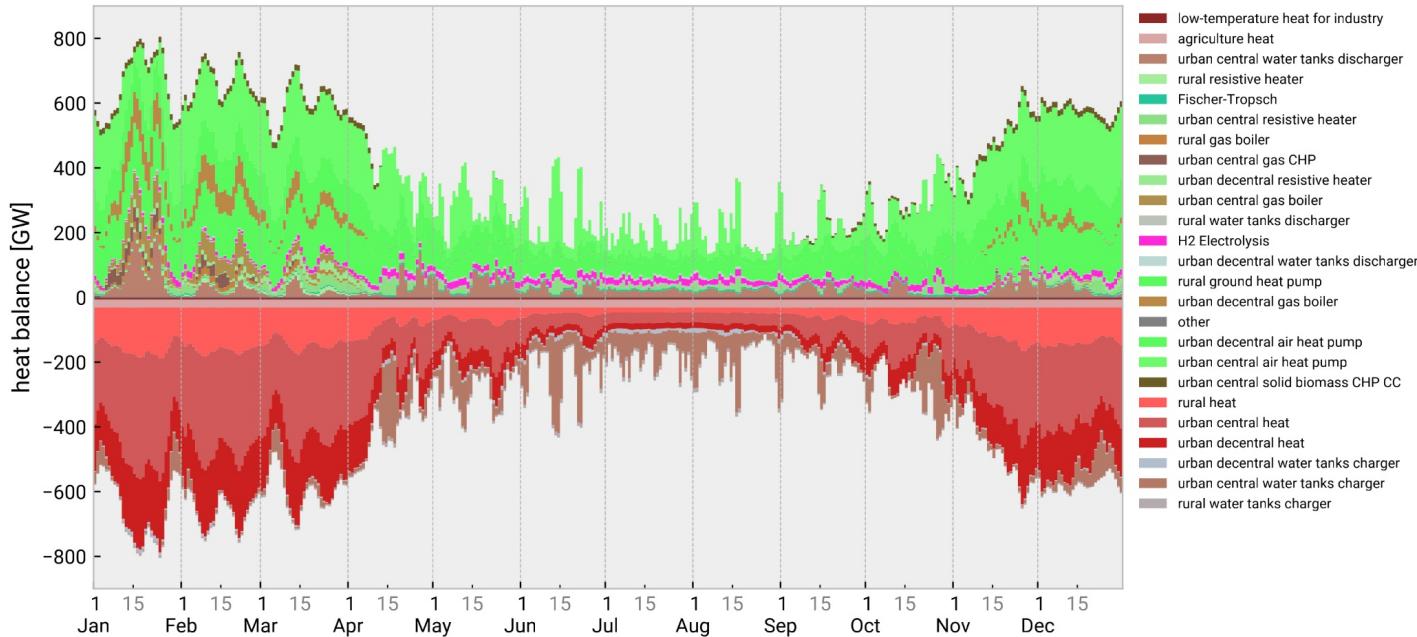

Heating - Heat pumps as new variable supply tech

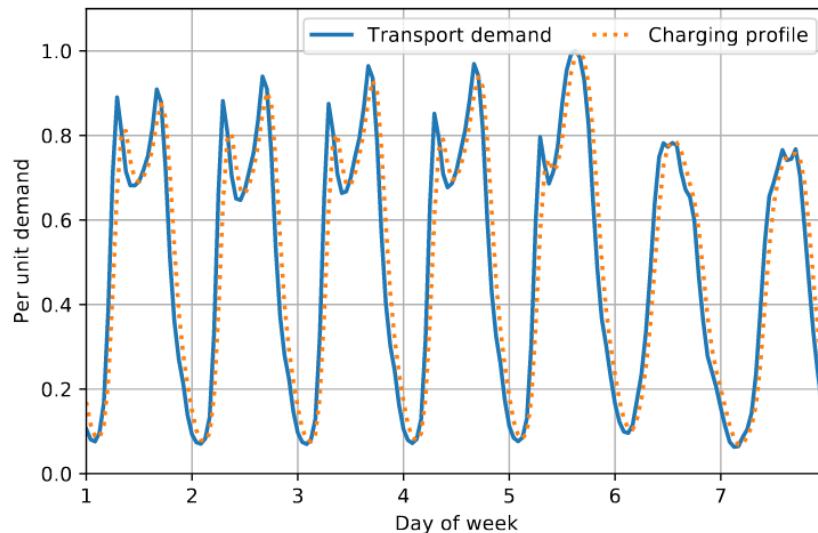

Geothermal heat
sources have
been integrated
very recently!

Heating - Example daily heat system balance

There are difficult periods in winter with **low** wind and solar, **high** space heating demand and **low** air temperatures, which are bad for air-sourced heat pump performance. In this case **gas boilers** and **CHP plants** jump in as backup.

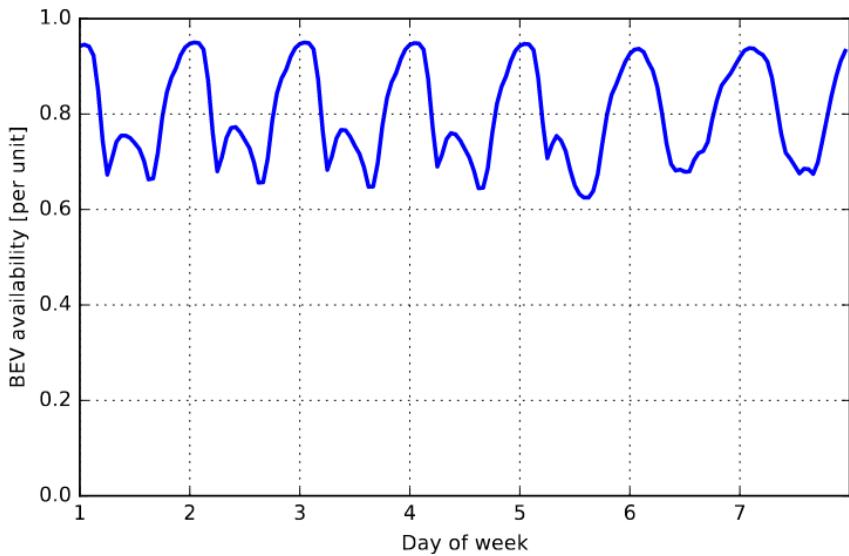

Transport - Electrification of land transport

Weekly profile for the transport demand based on statistics gathered by the German Federal Highway Research Institute (BASt).

- Road and rail transport is fully electrified (vehicle costs are not considered)
- Because of higher efficiency of electric motors, final energy consumption 3.5 times lower than today at 1100 TWh_{el}/a for Europe
- In model can replace Battery Electric Vehicles (BEVs) with Fuel Cell Electric Vehicles (FCEVs) consuming hydrogen. Advantage: hydrogen cheap to store. Disadvantage: efficiency of fuel cell only 60%, compared to 90% for battery discharging.

Transport - BEVs

Availability (i.e. fraction of vehicles plugged in) of Battery Electric Vehicles (BEV).

- Passenger cars to Battery Electric Vehicles (BEVs), 50 kWh battery available and 11 kW charging power
- Can participate in DSM and V2G, depending on scenario (state of charge returns to at least 75% every morning)
- All BEVs have time-dependent availability, averaging 80%, max 95% (at night)
- No changes in consumer behaviour assumed (e.g. car-sharing/pooling)
- BEVs are treated as exogenous (capital costs NOT included in calculation)

Technology choices - endogenous vs. exogenous

Exogenous assumptions (modeller chooses):

- energy services demand (e.g. heat)
- district heating shares
- energy carrier shares for road transport
- kerosene for aviation
- methanol for shipping
- electrification & recycling in industry
- steel production with DRI + EAF

Endogenous choices (model optimizes):

- change in electricity generation fleet
- transmission reinforcement
- capacities and locations of short and long-duration energy storage
- space and water heating technologies (including building renovations)
- all P2G/L/H/C
- supply of process heat for industry
- carbon capture (e.g. CHP, industry)

Supply, consumption and storage options by carrier

| Electricity (115 regions) | |
|---------------------------------------------------------|---------------------------------|
| Supply | Withdrawal |
| rooftop solar | industry electricity |
| utility-scale solar | residential electricity |
| onshore wind | services electricity |
| offshore wind (fixed-pole/floating, AC/DC-connected) | agriculture electricity |
| nuclear | air-sourced heat pump |
| hydro reservoirs | ground-sourced heat pump |
| pumped-hydro | resistive heater |
| run-of-river | electric vehicle charger |
| import by HVDC link | battery charger |
| gas CHP (w/wo CC) | pumped-hydro |
| biomass CHP (w/wo CC) | hydrogen pipeline (compression) |
| gas turbine (OCGT) | direct air capture |
| methanol turbine (OCGT) | Haber-Bosch |
| hydrogen turbine (OCGT) | electric arc furnace |
| hydrogen fuel cell CHP | direct iron reduction |
| battery discharger | distribution grid losses |
| vehicle-to-grid | transmission grid losses |
| | methanolisation |
| | electrolysis |
| Grids & Storage | |
| | distribution grid |
| | transmission grid |
| | battery storage |
| | pumped-hydro storage |
| | electric vehicles |

| Supply | Withdrawal |
|------------------------------------------|---------------------------------------------------------------------------------------------|
| import by pipeline | Fischer-Tropsch |
| import by ship | methanolisation |
| electrolysis | electrobiofuels |
| chlor-alkali electrolysis (exogenous) | direct iron reduction |
| steam methane reforming (w/wo CC) | Haber-Bosch |
| ammonia cracker | hydrogen turbine (OCGT) hydrogen fuel cell CHP methanol-to-kerosene Sabatier |
| <hr/> | |
| Grids & Storage | new pipelines retrofitted pipelines storage in salt caverns storage in steel tanks |
| <hr/> | |
| Methane (not spatially resolved) | |
| Supply | Withdrawal |
| import by ship | gas for high-T industry heat (w/wo CC) |
| fossil gas | steam methane reforming (w/wo CC) |
| biogas upgrading (w/wo CC) | gas boiler (rural/urban) |
| Sabatier | gas CHP gas turbine (OCGT) |
| Storage | hydrocarbon storage |

| Liquid Hydrocarbons (not spatially resolved) | |
|-----------------------------------------------------|-------------------------|
| Supply | Withdrawal |
| import by ship | kerosene for aviation |
| fossil oil refining | naphtha for industry |
| Fischer-Tropsch | diesel for agriculture |
| electrofuels | |
| Storage | hydrocarbon storage |
| Methanol (not spatially resolved) | |
| Supply | Withdrawal |
| import by ship | methanol turbine (OCGT) |
| methanolisation | methanol for shipping |
| | methanol for industry |
| | methanol-to-kerosene |
| Storage | hydrocarbon storage |
| Ammonia (not spatially resolved) | |
| Supply | Withdrawal |
| import by ship | ammonia cracker |
| Haber-Bosch | ammonia for fertilizer |
| Storage | ammonia tank |

Supply, consumption and storage options by carrier

| Heat (115 regions) | | CO2 atmosphere (not spatially resolved) | | CO2 commodity (not spatially resolved) | | | | | |
|---------------------------------------|---------------------|-----------------------------------------------------------|-----------------------------------|--------------------------------------------------------------------------|-----------------|--|--|--|--|
| Supply | Withdrawal | Supply | Withdrawal | Supply | Withdrawal | | | | |
| air-sourced heat pump | residential heat | kerosene for aviation | solid biomass for industry (w CC) | direct air capture | Fischer-Tropsch | | | | |
| ground-sourced heat pump (only rural) | services heat | diesel for agriculture | solid biomass CHP (w CC) | biogas upgrading (w CC) | methanolisation | | | | |
| resistive heater | agriculture heat | methanol for shipping | biogas upgrading (w CC) | gas CHP (w CC) | sequestration | | | | |
| gas boiler | low-T industry heat | methanol for industry | direct air capture | biomass CHP (w CC) | Sabatier | | | | |

| | | | | | | | | | |

Myopic pathway optimization

- Provide exogenous CO₂ emission **reduction path**.
- Optimise **start network** for e.g. 2025, starting with existing energy infrastructure.
- Take results from **2025 as input** for 2030 infrastructure optimisation, take 2030 results for next iteration, etc.
- The choice of **investment years** is arbitrary.
- **Perfect foresight pathway planning** is currently experimental (i.e. endogenous CO₂ budget).

Running many different scenarios with alternative configurations is straightforward and scalable in **snakemake!**

Live Demo – very similar to electricity-only case

Start with a dry-run:

```
$ snakemake all --configfile config/test/config.overnight.yaml -n
```

Then execute the same command “for real” by dropping “-n” flag:

```
$ snakemake all --configfile config/test/config.overnight.yaml
```

And for myopic pathway optimisation:

```
$ snakemake all --configfile config/test/config.myopic.yaml
```

To explore results, start a Jupyter notebook:

```
$ jupyter notebook
```

Practical Phase

(sector-coupled)

- 1) Run PyPSA-Eur sector-coupling tutorial with **snakemake**

Guide:

https://pypsa-eur.readthedocs.io/en/latest/tutorial_sector.html

snakemake all --configfile config/test/config.overnight.yaml

- 2) Explore CSV files and images in **results** directory.

Users of Windows, add two lines to YAML:

run:
 use_shadow_directory: false

Small exploratory configuration tasks

(sector-coupled)

Go to <https://pypsa-eur.readthedocs.io/en/latest/configuration.html> and try to find out how to configure some of the settings for **sector-coupled models** listed below:

1. Disable vehicle-to-grid discharging.
2. Disable methanation as technology option.
3. Increase the carbon sequestration potential to 500 Mt/a.
4. Allow hydrogen underground storage also onshore.
5. Reduce the primary production of plastics by increasing recycling rates.
6. Change the settings of all transmission so that they are lossless.
7. Disable the use of PtX waste heat.

Scenario management

PyPSA-Eur has integrated & scalable scenario management!

config/config.yaml

```
run:
    name: all
    scenarios:
        enable: true

scenario:
    clusters: [90]

sector:
    H2_network: true
    gas_network: true
    H2_retrofit: true

electricity:
    transmission_limit:
    vopt
```

With these two files configured, run:

\$ **snakemake all -n**

and

\$ **snakemake all**

config/scenarios.yaml

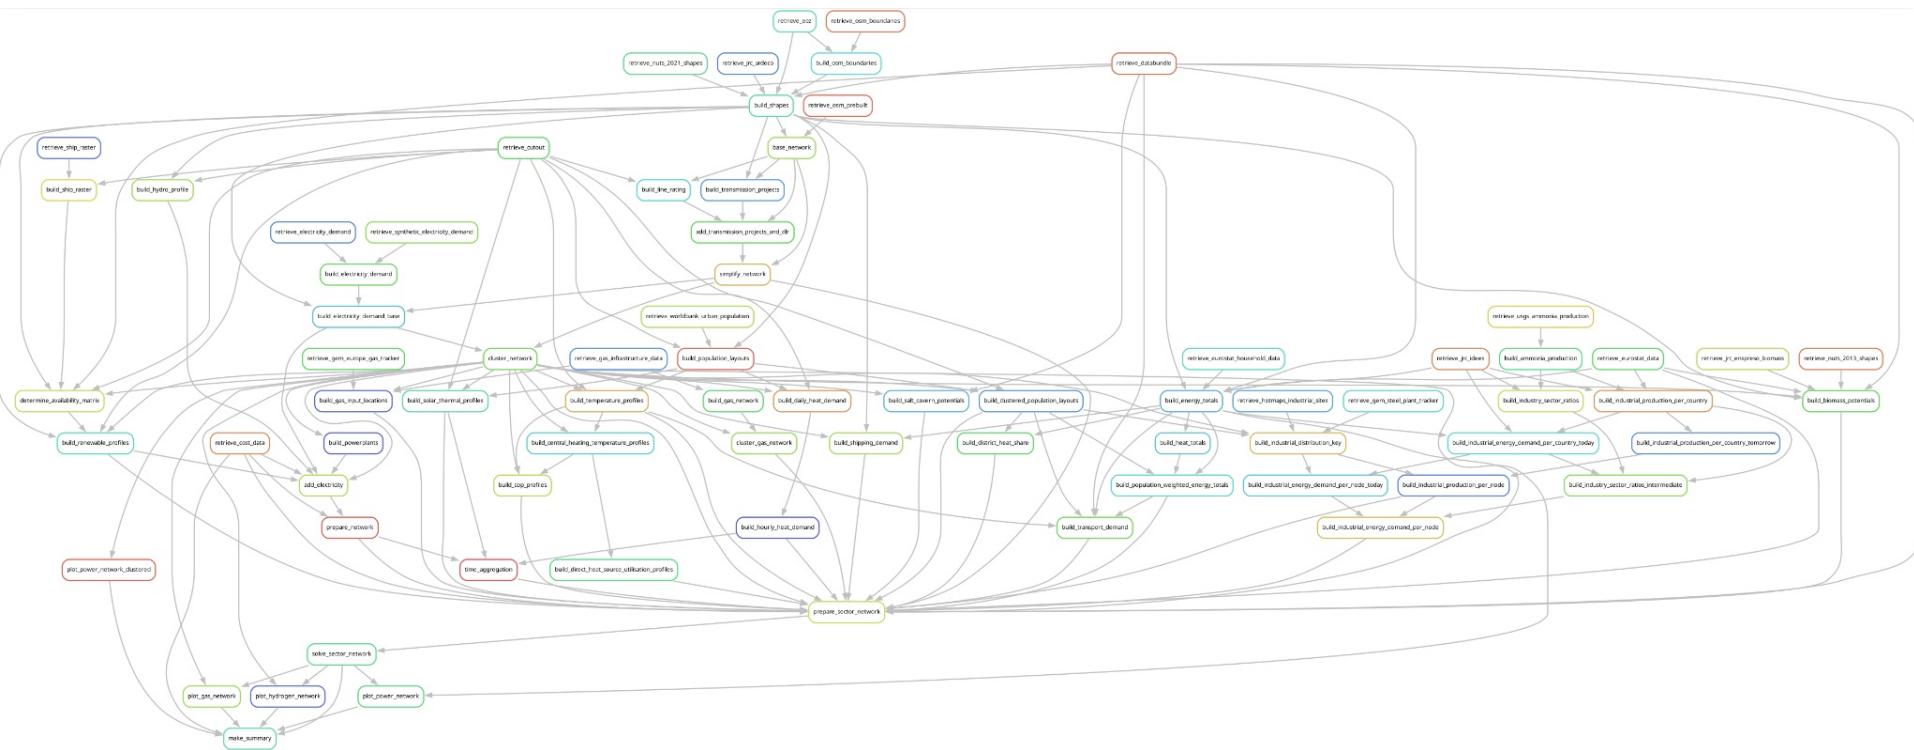

```
no-h2-network:
    sector:
        H2_network: false

no-grid-expansion:
    electricity:
        transmission: v1.0

no-to-both:
    sector:
        H2_network: false
    electricity:
        transmission:
v1.0

yes-to-both:
    sector:
        H2_network:
true
    electricity:
        transmission:
vopt
```

Closing remark – There is much more to explore!

Article

The potential role of a hydrogen network in Europe

We examine the interplay between a continent-wide hydrogen network and electricity grid expansion in Europe to help balance variations in wind and solar energy supply. By adapting existing natural gas pipelines for hydrogen transport, energy system costs can be reduced, especially when power grid reinforcements are not possible. Both types of transmission infrastructure offer cost-effective options for achieving a European energy system with net-zero CO₂ emissions. However, with a 10% cost increase, it is possible to build neither.

Fabian Neumann, Elisabeth Zeyen, Marta Victoria, Tom Brown

f.neumann@tu-berlin.de

Highlights

Examination of the cost benefit of a European hydrogen network in net-zero emission scenarios

H₂ network reduces system costs by up to 3.4%, highest without power grid expansion

Between 64% and 69% of the hydrogen network uses retrofitted gas network pipelines

Power grid expansion saves more than hydrogen network, but strongest savings with both
